FUNCTIONS

HOW IT WORKS

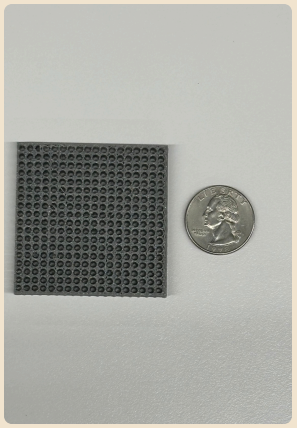

1. **Scan**
   Scan the injured astronaut's lower leg.
2. **Print**
   Print the custom shell and straps on the habitat printer.
3. **Fit**
   Unlatch the splint and fit it on vertically.
4. **Secure**
   Wrap the straps in an X, three times around the ankle.
5. **Adjust & clean**
   Loosen or tighten one-handed; remove for hygiene.

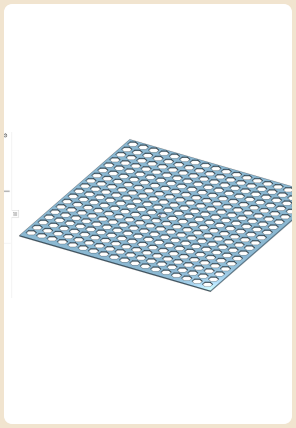

Hanging-weight test

Printed sample, split along the holes

TPU sample, quarter for scale

CAD test sample

LUNAR SPLINT DESIGN CHALLENGE

ORTHOPRINT

by Team Lunova

A custom-fit splint for a lateral ankle ligament tear, 3D-printed on demand on a lunar base.

SCHOOL #	_____
TEACHERS	Lupita C. Vasquez and Claudia Cortez
NASA PROJECT	Lunar Splint Design Challenge
TEAM PROJECT	Lunova · OrthoPrint

PRODUCT VALUE

PRINTED FOR ONE ASTRONAUT, WHEN THEY NEED IT

OrthoPrint is a custom splint for a lateral ankle ligament tear that a lunar base prints on demand from a scan of the astronaut's leg. Instead of launching a full set of fixed-size splints at about $1,000 per gram, the habitat prints one that fits.

TOP ATTRIBUTES

1. **Custom fit**
   Printed from a scan of the patient's limb.
2. **One-handed straps**
   Reusable zip-tie style straps the astronaut can tighten alone.
3. **Firm support**
   Solid shell, straps in the athletic-tape X pattern.
4. **Built for weeks of wear**
   Hygiene features for cleaning and skin checks.
5. **Thermal phase design**
   TPU flexible enough to wrap the leg, firm when needed.
6. **Made in the habitat**
   Printable on a habitat FDM or SLA printer.

THE PROBLEM

NO HOSPITAL ON THE MOON

Astronauts on a lunar base face a high risk of musculoskeletal injury, and a return to Earth takes days at minimum. Launching splints in every size wastes launch mass. A lunar base needs a custom splint it can print on demand from a patient scan.

$1M	1/6 g	−1–2%
launch cost per kilogram	lunar gravity	bone density per month

LUNAR-SPECIFIC INNOVATIONS

BUILT FOR THE MOON

INNOVATION 1

SINGLE-PIECE RATCHET CLOSURE

Zip-tie style straps with no loose parts, tightened or released with one hand.

INNOVATION 2

INTEGRATED HYGIENE

A breathable, sanitary design that can be cleaned and checked over weeks of wear.

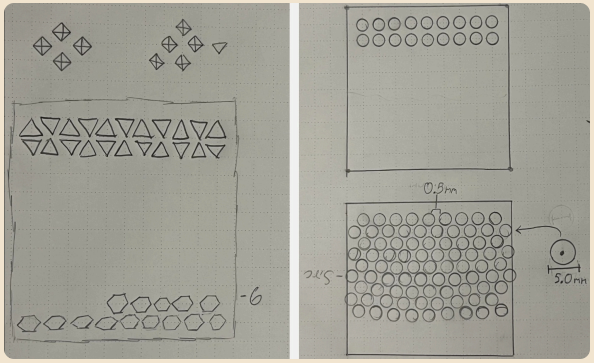

INNOVATION 3

THERMAL PHASE DESIGN

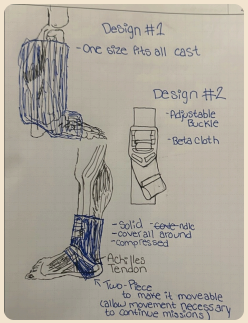

A TPU element flexible enough to wrap the leg and firm when needed.

DESIGN PROCESS

FROM SKETCH TO SPLINT

Hole patterns · Gertrudis Hernandez

Concepts 1 & 2 · Nancy De La Cruz

CONCEPT 1

One-size cast. A cast is not a splint, so we switched.

CONCEPT 2

Two pieces with an adjustable buckle.

TESTING

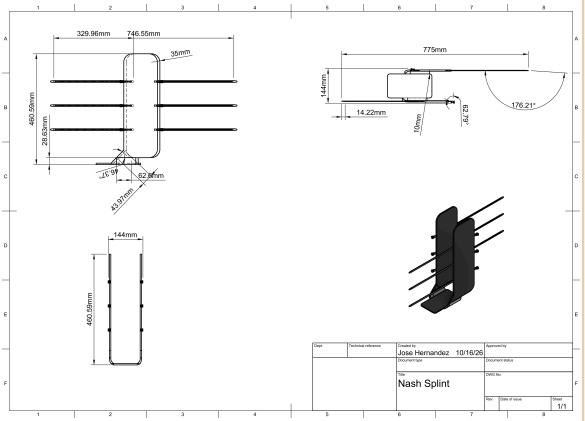

Holes made it too flexible, so the wall went solid.

NOW

Unlatches, fits on vertically, zip-tie straps in an X.

TECHNICAL SPECIFICATIONS

ORTHOPRINT	PROTOTYPE #1 · OCT 2026
INJURY	Lateral ankle ligament tear (3–26 weeks)
FIT	Custom, from a limb scan
CLOSURE	Reusable zip-tie style straps, X pattern
SHELL	Solid wall; small vents being re-tested
PRINTER	Habitat FDM or SLA
PROTOTYPE	PLA, ABS, TPU (PETG tested)
FLIGHT	CF-PEEK (recommended)
SIZE	460.59 mm tall; side plates 144 mm apart
MASS	To be measured from the final CAD
PRINT TIME	To be measured from the final CAD
SOFTWARE	None. OrthoPrint is a printed device
