OUR PROTOTYPE

Straps that lock like a zip tie

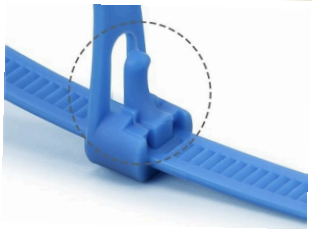

Front

Side

Back

The reusable zip tie behind our closure

Our value: OrthoPrint gives an injured astronaut a splint made for their own ankle, printed on the lunar base and strapped on with one hand.

CAD & videos: **gertrudish978-pixel.github.io/lunar-splint**

What we tested

PETG with holes broke when bent	NO
TPU with holes layers split	NO
Solid TPU firm, moulds slightly	CHOSEN
Straps at key points ankle stayed still	CHOSEN

THE PROBLEM

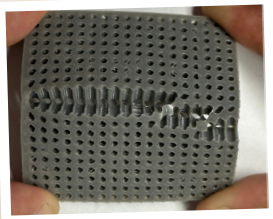

No hospital on the Moon

If an astronaut tears an ankle ligament on a lunar base, the ride home takes days. The crew needs a splint that fits, made right there.

$1,000 to launch every gram, so a box of splints in every size is out

1/6 g lunar gravity, and weeks of wear in a closed habitat

3–26 weeks for a torn ankle ligament to heal

Holes split, so we went solid

Hanging-weight test

WHAT WE HEARD

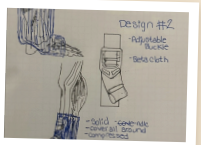

Needs Assessment Survey · 56 students

Ankle injured most	63%
Hard to find a fit	54%
On their feet a lot	96%
Devices help healing	98%

HOW IT WORKS

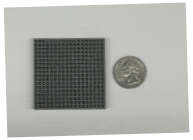

From scan to splint

1. **Scan** — Scan the injured astronaut's lower leg.

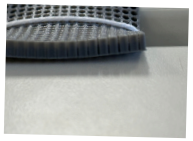

Early concepts

2. **Print** — Print the shell and straps on the base.

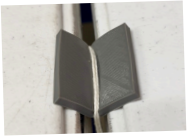

TPU sample

3. **Fit** — Unlatch it and slide it on from above.

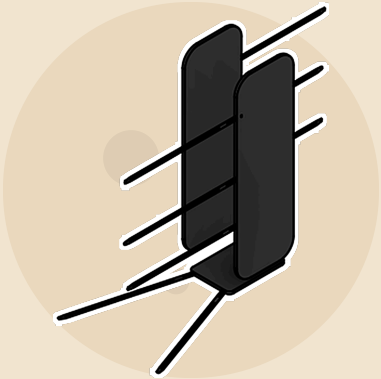

Solid TPU wall

4. **Strap** — Wrap the straps in an X and tighten with one hand.

Strap load test

LUNAR INNOVATIONS

Built for the Moon

1. **Single-piece ratchet closure**
Tightens or releases with one hand. No loose parts to lose.

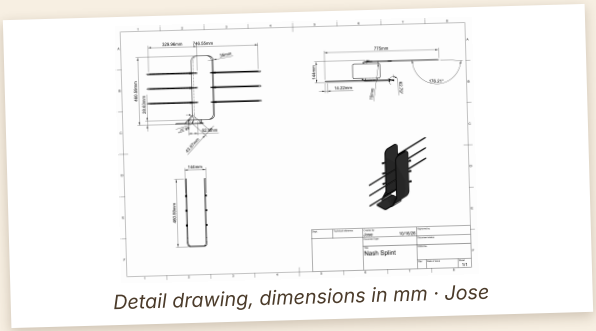

2. **Integrated hygiene**
Comes off to clean the splint and check the skin.

3. **Thermal phase design**
Flexible to put on, firm to hold the ankle still.

MATERIALS

PLA · ABS · TPU · PETG

CF-PEEK for flight

Detail drawing, dimensions in mm · Jose

Next steps

- Test strap thickness and break load
- Find where the filament softens with heat
- Build prototype #2 for the CDR
